

$$\begin{aligned}
& - \begin{vmatrix} 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \end{vmatrix} \xrightarrow{\underline{\underline{R_3 \leftrightarrow R_2}}} \begin{vmatrix} 0 & -1 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \end{vmatrix} \xrightarrow{\underline{\underline{R_2 \leftrightarrow R_1}}} \\
& - \begin{vmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 & 0 & -1 \end{vmatrix} = -(1)(-1)(-1)(-1)(-1)(-1) = (-1)^6 = 1
\end{aligned}$$

Therefore, the determinant of the 6×6 matrix is 1:

$$\begin{vmatrix} 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & 2 & 2 & 2 & 2 & 2 \\ 1 & 2 & 3 & 3 & 3 & 3 \\ 1 & 2 & 3 & 4 & 4 & 4 \\ 1 & 2 & 3 & 4 & 5 & 5 \\ 1 & 2 & 3 & 4 & 5 & 6 \end{vmatrix} = 1.$$

□

Problem 2 Prove that

$$\det \begin{pmatrix} a & b & c \\ b+c & c+a & a+b \\ a^2 & b^2 & c^2 \end{pmatrix} = -(a-b)(b-c)(c-a)(a+b+c).$$

Proof. We can use row operations and their effects on the determinant to help us solve the 6×6 matrix.

$$\begin{aligned}
& \begin{vmatrix} a & b & c \\ b+c & c+a & a+b \\ a^2 & b^2 & c^2 \end{vmatrix} \xrightarrow{\underline{\underline{R_2+R_1}}} \begin{vmatrix} a & b & c \\ a+b+c & a+b+c & a+b+c \\ a^2 & b^2 & c^2 \end{vmatrix} = \\
& (a+b+c) \begin{vmatrix} a & b & c \\ 1 & 1 & 1 \\ a^2 & b^2 & c^2 \end{vmatrix} \xrightarrow{\underline{\underline{R_3-R_1}}} (a+b+c) \begin{vmatrix} a & b & c \\ 1 & 1 & 1 \\ a^2-1 & b^2-1 & c^2-1 \end{vmatrix} = \\
& (a+b+c) \begin{vmatrix} a & 1 & a^2-1 \\ b & 1 & b^2-1 \\ c & 1 & c^2-1 \end{vmatrix} \xrightarrow[\underline{\underline{R_3-R_1}}]{\underline{\underline{R_2-R_1}}} (a+b+c) \begin{vmatrix} a & 1 & a^2-1 \\ b-a & 0 & b^2-1-a^2-1 \\ c-a & 0 & c^2-1-a^2-1 \end{vmatrix} = \\
& (a+b+c) \begin{vmatrix} a & 1 & a^2-1 \\ b-a & 0 & b^2-a^2 \\ c-a & 0 & c^2-a^2 \end{vmatrix} = (a+b+c) \begin{vmatrix} a & 1 & a^2-1 \\ b-a & 0 & (b+a)(b-a) \\ c-a & 0 & (c+a)(c-a) \end{vmatrix} = \\
& (b-a)(c-a)(a+b+c) \begin{vmatrix} a & 1 & a^2-1 \\ 1 & 0 & (b+a) \\ 1 & 0 & (c+a) \end{vmatrix} = (b-a)(c-a)(a+b+c)(1)(-1)[(c+a)-(b+a)] = \\
& (b-a)(c-a)(a+b+c)(1)(-1)(c-b) = (b-a)(c-a)(a+b+c)(b-c) = -(a-b)(b-c)(c-a)(a+b+c)
\end{aligned}$$

Therefore, the determinant of the 3×3 matrix is $-(a-b)(b-c)(c-a)(a+b+c)$:

$$\det \begin{pmatrix} a & b & c \\ b+c & c+a & a+b \\ a^2 & b^2 & c^2 \end{pmatrix} = -(a-b)(b-c)(c-a)(a+b+c).$$

□

Problem 3 Find the adjoint of the matrix

$$A = \begin{pmatrix} 2 & 1 & 1 \\ -1 & 0 & 2 \\ 3 & 1 & 3 \end{pmatrix}.$$

Then use the adjoint to find A^{-1} .

Work. To find the adjoint of matrix A , we have to find the cofactors for each element of the matrix, and then transpose the matrix.

$$\begin{aligned} A &= \begin{pmatrix} 2 & 1 & 1 \\ -1 & 0 & 2 \\ 3 & 1 & 3 \end{pmatrix} \xrightarrow{(\text{cofactor})} \begin{pmatrix} (0 \cdot 3 - 1 \cdot 2) & -(-1 \cdot 3 - 3 \cdot 2) & (-1 \cdot 1 - 3 \cdot 0) \\ -(1 \cdot 3 - 1 \cdot 1) & (2 \cdot 3 - 3 \cdot 1) & -(2 \cdot 1 - 3 \cdot 1) \\ (1 \cdot 2 - 0 \cdot 1) & -(2 \cdot 2 - (-1) \cdot 1) & (2 \cdot 0 - (-1) \cdot 1) \end{pmatrix} = \\ &= \begin{pmatrix} (-2) & -(-9) & (-1) \\ -(2) & (3) & -(-1) \\ (2) & -(-5) & (1) \end{pmatrix} = \begin{pmatrix} -2 & 9 & -1 \\ -2 & 3 & 1 \\ 2 & -5 & 1 \end{pmatrix} \xrightarrow{(\text{transpose})} \begin{pmatrix} -2 & -2 & 2 \\ 9 & 3 & -5 \\ -1 & 1 & 1 \end{pmatrix} \end{aligned}$$

We can then use the equation $A^{-1} = \frac{1}{\det(A)} \text{adj}(A)$ to find A^{-1} using $\text{adj}(A)$ and $\det(A)$.

$$\begin{aligned} \det(A) &= \begin{vmatrix} 2 & 1 & 1 \\ -1 & 0 & 2 \\ 3 & 1 & 3 \end{vmatrix} \xrightarrow{R_1+R_2} \begin{vmatrix} 1 & 1 & 3 \\ -1 & 0 & 2 \\ 3 & 1 & 3 \end{vmatrix} \xrightarrow{\substack{R_3-3R_1 \\ R_2+R_1}} \begin{vmatrix} 1 & 1 & 3 \\ 0 & 1 & 5 \\ 0 & -2 & -6 \end{vmatrix} = \\ &= (1)(1)(1 \cdot -6 - (-2) \cdot 5) = (-6 + 10) = 4 \end{aligned}$$

Therefore, $A^{-1} = \frac{1}{4} \text{adj}(A)$:

$$A^{-1} = \frac{1}{4} \text{adj}(A) = \frac{1}{4} \begin{pmatrix} -2 & -2 & 2 \\ 9 & 3 & -5 \\ -1 & 1 & 1 \end{pmatrix} = \begin{pmatrix} -\frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ \frac{9}{4} & \frac{3}{4} & -\frac{5}{4} \\ -\frac{1}{4} & \frac{1}{4} & \frac{1}{4} \end{pmatrix}$$

□

Problem 6 Determine ALL values a and b such that

$$\left\{ \begin{pmatrix} a & b \\ b & b \end{pmatrix}, \begin{pmatrix} b & a \\ b & b \end{pmatrix}, \begin{pmatrix} b & b \\ a & b \end{pmatrix}, \begin{pmatrix} b & b \\ b & a \end{pmatrix} \right\}$$

is linearly independent.

Work. Let $k_1, k_2, k_3, k_4 \in \mathbb{R}$ such that

$$k_1 \begin{pmatrix} a & b \\ b & b \end{pmatrix} + k_2 \begin{pmatrix} b & a \\ b & b \end{pmatrix} + k_3 \begin{pmatrix} b & b \\ a & b \end{pmatrix} + k_4 \begin{pmatrix} b & b \\ b & a \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}.$$

From this, we can get a linear system of equations, and a matrix equation.

$$ak_1 + bk_2 + bk_3 + bk_4 = 0$$

$$bk_1 + ak_2 + bk_3 + bk_4 = 0$$

$$bk_1 + bk_2 + ak_3 + bk_4 = 0$$

$$bk_1 + bk_2 + bk_3 + ak_4 = 0$$

$$\begin{pmatrix} a & b & b & b \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{pmatrix} \begin{pmatrix} k_1 \\ k_2 \\ k_3 \\ k_4 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Consider the determinant of the square matrix.

$$\begin{aligned} & \begin{vmatrix} a & b & b & b \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{vmatrix} \xrightarrow[\substack{R_1+R_2+R_3 \\ R_1+R_4}]{=} \begin{vmatrix} a+3b & a+3b & a+3b & a+3b \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{vmatrix} = (a+3b) \begin{vmatrix} 1 & 1 & 1 & 1 \\ b & a & b & b \\ b & b & a & b \\ b & b & b & a \end{vmatrix} \xrightarrow[\substack{R_2-aR_1, R_4-R_1 \\ R_3-aR_1}]{=} \\ & (a+3b) \begin{vmatrix} 1 & 1 & 1 & 1 \\ b-a & 0 & b-a & b-a \\ b-a & b-a & 0 & b-a \\ b-a & b-a & b-a & 0 \end{vmatrix} = (a+3b)(b-a)^3 \begin{vmatrix} 1 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{vmatrix} \xrightarrow[\substack{R_2-R_1, R_4-R_1 \\ R_3-R_1}]{=} \\ & (a+3b)(b-a)^3 \begin{vmatrix} 1 & 1 & 1 & 1 \\ 0 & -1 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{vmatrix} = (a+3b)(b-a)^3(1)(-1)(-1)(-1) = -(a+3b)(b-a)^3 \end{aligned}$$

In order to ensure that $-(a+3b)(b-a)^3 \neq 0$, $a+3b \neq 0$ and $b-a \neq 0$. These conditions will ensure that the determinant of this matrix will not be zero. By Theorem 4 of Lecture Notes 32, as long as the determinant of a square matrix is not zero, the inverse of the matrix exists. Then, by the Big Theorem, if the coefficient matrix is invertible, then $A\vec{x} = \vec{0}$ has only the trivial solution. This means that there does not exist $k_1, k_2, k_3, k_4 \in \mathbb{R}$ such that

$$k_1 \begin{pmatrix} a & b \\ b & b \end{pmatrix} + k_2 \begin{pmatrix} b & a \\ b & b \end{pmatrix} + k_3 \begin{pmatrix} b & b \\ a & b \end{pmatrix} + k_4 \begin{pmatrix} b & b \\ b & a \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}.$$

This means that

$$\left\{ \begin{pmatrix} a & b \\ b & b \end{pmatrix}, \begin{pmatrix} b & a \\ b & b \end{pmatrix}, \begin{pmatrix} b & b \\ a & b \end{pmatrix}, \begin{pmatrix} b & b \\ b & a \end{pmatrix} \right\}$$

are linearly independent when $a+3b \neq 0$ and $b-a \neq 0$. □

Problem 7 Prove or disprove the following statement:

$$\det(A^T A) \geq 0 \text{ for all } n \times n \text{ matrices } A.$$

Proof. We can use Theorem 1 and Theorem 6 from Lecture notes 32 to help proof the statement.

$$\text{Thm 1. } \det A = \det A^T$$

$$\text{Thm 6. } \det AB = \det A \det B$$

Case 1: $\det A \geq 0$. Through Theorem 1, this implies that $\det A^T \geq 0$, since $\det A = \det A^T$.

$$\begin{aligned} \det A &\geq 0 \\ \det A^T \cdot \det A &\geq 0 \cdot 0 && \text{Thm 1.} \\ \det(A^T A) &\geq 0 && \text{Thm 6.} \end{aligned}$$

Case 2: $\det A < 0$. Through Theorem 1, this implies that $\det A^T < 0$, since $\det A = \det A^T$.

$$\begin{aligned} \det A &< 0 \\ \det A^T \cdot \det A &> 0 \cdot 0 && \text{Thm 1.} \quad (\text{inequality switches because of mult. by a negative}) \\ \det(A^T A) &> 0 && \text{Thm 6.} \\ \det(A^T A) &\geq 0 && (> \text{ also implies } \geq) \end{aligned}$$

Since $\det A$ must either be greater than or equal to zero, or less than zero, and the statement is true for both possibilities, this means that

$$\det(A^T A) \geq 0 \text{ for all } n \times n \text{ matrices } A.$$

□

Problem 8 Let $V = \mathcal{M}_{nn}$, the vector space containing all $n \times n$ matrices. Prove or disprove:

$$W = \{A \in V : \det(A) = 0\} \text{ forms a subspace of } V.$$

Proof. To prove whether or not $W = \{A \in V : \det(A) = 0\}$ is a subspace of $V = \mathcal{M}_{nn}$, both Axioms 1 and Axioms 6 must hold.

Proof. Axiom 1: Closed under vector addition

$$\text{Consider } A_{n \times n} = \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 \end{pmatrix} \text{ and } B_{n \times n} = \begin{pmatrix} 0 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{pmatrix}. \text{ Since } A \text{ and } B \text{ are diagonal}$$

matrices, through Theorem 1 of Lecture Notes 31,

$$\begin{aligned} \det A &= 1 \cdot 0 \cdot 0 \cdots 0 = 0, \text{ and} \\ \det B &= 0 \cdot 1 \cdot 1 \cdots 1 = 0. \end{aligned}$$

This means that both A and $B \in W$. Now consider $C = A + B$:

$$C_{n \times n} = \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ 0 & 0 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 0 \end{pmatrix} + \begin{pmatrix} 0 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{pmatrix}.$$

C is also a diagonal matrix. Therefore, through Theorem 1 of Lecture Notes 31,

$$\det(A + B) = \det(C) = 1 \cdot 1 \cdot 1 \cdots 1 = 1 \neq 0$$

W is not closed under addition, meaning that Axiom 1 does not hold. □

Since Axiom 1 does not hold for W , it cannot possibly be a subspace of $V = \mathcal{M}_{nn}$. □
